Professional Summary

Aspiring AI/ML Engineer and B.E. Computer Science & Engineering (AI & ML) student with strong foundations in Python, Core Java, SQL, Object-Oriented Programming, Machine Learning, Deep Learning, NLP, and Retrieval-Augmented Generation. Experienced in building practical AI and software projects involving RAG pipelines, hybrid retrieval, vector databases, neural reranking, and web applications. Seeking an AI/ML or Software Developer to apply problem-solving and engineering skills to real-world products.

Education

Anjuman-I-Islam's Kalsekar Technical Campus, New Panvel **Expected 2027**
Bachelor of Engineering (CSE – AI & ML) CGPA: **7.48**

Technical Skills

Programming	Python, Java, SQL
AI / Machine Learning	Machine Learning, Deep Learning, NLP
Frameworks / Libraries	TensorFlow, Scikit-learn
Core CS	Object-Oriented Programming
Database	SQLite
Tools	Git, GitHub, VS Code, Google Colab, Kaggle, Docker
Currently Learning	Agentic AI, Retrieval-Augmented Generation (RAG)

Projects

DocuRAG - Universal Document Intelligence Assistant

- Built an end-to-end Retrieval-Augmented Generation (RAG) system that allows users to upload PDF, DOCX, TXT, and CSV documents and ask natural-language questions about their content.
- Implemented a multi-stage retrieval pipeline combining ChromaDB MMR semantic retrieval (70%) with BM25 keyword retrieval (30%), followed by CrossEncoder reranking to select the top 3 relevant document chunks.

Lightweight Image Classifier for Edge Devices

- Built an end-to-end CNN image classification pipeline using 26K+ images across 10 classes targeting deployment on resource-constrained edge devices such as AR glasses and wearables.
- Designed and compared a baseline CNN with an optimized lightweight CNN using Global Average Pooling, achieving a 134x reduction in model size from 12.6 MB to 96 KB.
- Addressed class imbalance with targeted data augmentation after evaluating class-weighting approaches; implemented stratified splitting and EarlyStopping/ModelCheckpoint callbacks for reproducible training.

Airline Reservation System

- Developed a console-based Airline Reservation System using Core Java and Object-Oriented Programming principles.
- Implemented Admin and Passenger authentication with dedicated functionalities for flight and booking management.
- Built modules for flight search, ticket booking, cancellation, seat availability, fare calculation, and booking history.
- Applied Java Collections, exception handling, and modular class design to improve maintainability and reliability.

CreditGuard - Loan Default Risk Prediction

- Developed a machine learning-based loan default risk prediction system to assist financial institutions in evaluating loan applicants.
- Built a Logistic Regression model using historical loan application data to predict whether an applicant is likely to default on a loan.
- Performed data preprocessing, feature engineering, and exploratory data analysis using Pandas and NumPy to improve model performance.
- Classified applicants into Low, Medium, and High risk categories based on prediction scores to support informed lending decisions.

Key Highlights

- Strong foundation in Python, Core Java, SQL, Object-Oriented Programming, Machine Learning, Deep Learning, NLP.
- Experience with Git and GitHub for version control, project development, and collaborative workflows.
- Strong interest in AI Engineering, Generative AI, backend development, and scalable AI systems.
